

# pSTACK

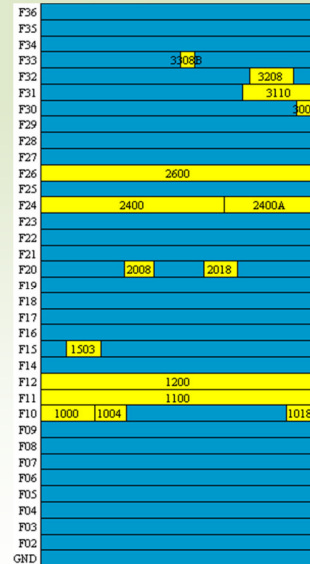

## Creating Web Content from Propidex Office

PStack is an Office add-on module to Propidex that can automatically create web content from the information you have created in Propidex .

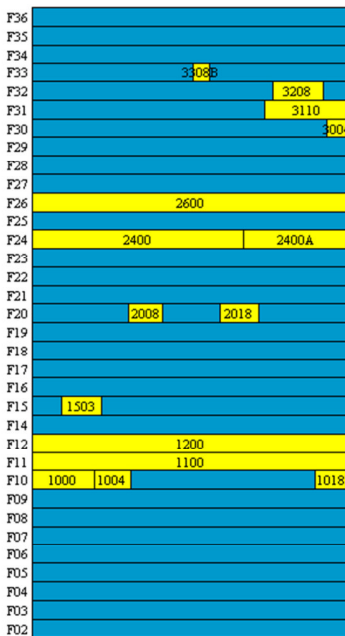

The primary benefit of pStack is that it creates **consistent looking, simplified stacking plans and listing pages** from the data and drawings from within Propidex. There is no additional updating or intervention required.

The Leasing agents identify what spaces they want to list in Propidex and then when a stack gets generated, only those spaces that have been flagged are highlighted.

Information that the Leasing agents maintain about divisible area, availability date and comments get published to the html pages.

Elopez@JML.com

The stack represents the building with just those units listed in Propidex showing as yellow. Other floor details are suppressed.

Each of the yellow units are clickable and bring you to that unit's specific listing page.

The list is also clickable and shows the information that was input in the Propidex listing form.

*pStack creates an interactive stack page for every building selected. When you click on one of the listings, you are brought to the listing page.....*

## How pStack Works

pStack is a single user, desktop application that generates (upon request) html files, javascript, and associated graphics that can be linked to your existing website.

The pStack program reads the Propidex database to directly retrieve the latest building, stack, floorplan and listing information. This way, you control how often your website gets updated.

## pStack Components

### PStack Components

- pStack.exe application
- file that specifies the database location and where to deposit the files
- a CSS file
- graphic (png) files for the logo and info icon.

### Technical Requirements

- ✓ Admin rights for Desktop installation
- ✓ Network connectivity to database
- ✓ Windows XP or higher
- ✓ 1 Mb RAM
- ✓ 100 MB Hard Disk
